

I'm not a robot

The Shingrix vaccine is a nonliving vaccine made of a virus component and is recommended for people age 50 and older, whether they've had shingles or not. Those who have weakened immune systems due to disease or medication may also receive the vaccine. Two doses of the vaccine are given, with 2 to 6 months between doses. The most common side effects of the vaccine are redness, pain, and swelling at the injection site. Some people also experience fatigue, headache, and other side effects. However, having the vaccine does not guarantee that you won't get shingles. Nevertheless, it will likely reduce the course and severity of the disease. The vaccine is used to prevent shingles and its potential complications, such as postherpetic neuralgia. Studies suggest that Shingrix offers protection against shingles for more than five years. Talk to your healthcare provider about your vaccination options if you have concerns or questions.
