

I'm not a robot

ShadownounEtymology: scadu , Saxon; schaduwe, Dutch.1. The representation of a body by which the light is intercepted.Poor Tom! proud of heart, to ride over four inchd bridges, to course his own shadow for a traitor.William Shakespeare.Lifes but a walking shadow, a poor player,That struts and frets his hour upon the stage,And then is heard no more.William Shakespeare.Such a nature,Tickld with good success, disdains the shadowWhich he treads on at noon.William Shakespeare.The body, tho it moves, yet not changing perceivable distance with some other bodies, the thing seems to stand still, as in the hands of clocks, and shadows of sun-dials,John Locke.2. Opacity: darkness; shade: By the revolution of the skiesNights sable shadows from the ocean rise,John Denham.His countrymen probably lived within the shake of the earthquake and shadow of the eclipse.Addison.3. Shelter made by any thing that intercepts the light, heat, or influence of the air.In secret shadow from the sunny ray,On a sweet bed of lillies softly laid.Fa. Queen.Here father, take the shadow of this treeFor your good host.William Shakespeare, K. Lear.4. Obscure place.To the secret shadows I retire.To pay my penance till my years expire.Dryd.5. Dark part of a picture.A shadow is a diminution of the first and second light. The first light is that which proceeds immediately from a lightned body, as the beams of the sun. The second is an accidental light spreading itself into the air or medium proceeding from the other. Shadows are threefold: the first is a single shadow, and the least of all; and is proper to the plain surface where it is not wholly possessed of the light. The second is the double shadow, and it is used when the surface begins once to forsake your eye, as in columns. The third shadow is made by crossing over your double shadow again, which darkneth by a third part. It is used for the inmost shadow, and farthest from the light, as in gulls, wells, and caves.Henry Peacham.After great lights there must be great shadows.Dryden.6. Any thing perceptible only to the sight: a ghost; a spirit, or shade.Hence, terrible shadow!Unreal mockery, hence!William Shakespeare.7. An imperfect and faint representation: opposed to substance.If substance might be called that shadow seemd,John Milton.In the glorious lights of heaven we perceive a shadow of his divine countenance.Walter Raleigh.Without the least impulse or shadow of fate,John Milton.Amongst the creatures are particular excellencies scattered, which are some shadows of the divine perfections,John Tillotson.8. Inseparable companion.Sin and her shadow, death,John Milton.Thou my shadowInseparable must with me be longJohn Milton.9. Type; mystical representation.Types and shadows of that destind seed,John Milton.10. Protection; shelter; favour.Keep me under the shadow of thy wings.Psalms.To ShadowverbEtymology: from the noun.1. To cover with opacity.The warlike elf much wondered at this tree,So fair and great, that shadowed all the ground.Fa. Q.The Assyrian was a cedar with fair branches, and with a shadowing shroud.Ezek. xxxi. 3.2. To cloud; to darken.Mislike me not for my complexion;The shadow livery of the burning sunFo whom I am a neighbour.William Shakespeare.3. To make cool or gently gloomy by interception of the light or heat.A gentle south-west wind comes creeping over flowery fields and shadowd waters in the extreme heat of summer.Philip Sidney.4. To conceal under cover; to hide; to screen.Let every soldier hew him down a bough,And beat before him; thereby shall we shadowThe number of our host, and make discoveryErr in report of us.William Shakespeare.5. To protect; to screen from danger; to shroud.God shall forgive you Cur de Lions death,The rather, that you give his offspring life,Shad wing their right under your wings of war.William Shakespeare.6. To mark with various gradations of colour, or light.Turnsoll is made of old linnen rags dried, and laid in a saucer of vinegar, and set over a chafing dish of coals till it boil; then wring it into a shell, and put it into a little gum arabick: it is good to shadow carnations, and all yellows.Henry Peacham.From a round globe of any uniform colour, the idea imprinted in our minds is of a flat circle, variously shadowed with different degrees of light coming to our eyes,John Locke.More broken scene, made up of an infinite variety of inequalities and shadowings, that naturally arise from an agreeable mixture of hills, groves, and vallies.Addis.7. To paint in obscure colours. If the parts be too much distant, so that there be void spaces which are deeply shadowed, then place in those voids some fold to make a joining of the parts,John Dryden, Dufresnoy.8. To represent imperfectly.Whereat I waked and foundBefore mine eyes all real, as the dreamHad lively shadowd,John Milton, Parad. Lost.Augustus is shadowed in the person of neas.Dryd.I have shadowed some part of your virtues under another name.Dryd.9. To represent typically.Many times there are three things said to make up the substance of a sacrament; namely, the grace which is thereby offered, the element which shadoweth or signifieth grace, and the word which expresseth what is done by the element.Hook.The shield being to defend the body from weapons, aptly shadows out to us the continence of the emperor, which made him prof to all the attacks of pleasure.Addison.Area where light is blocked by an objectFor other uses, see Shadow (disambiguation).This article needs additional citations for verification. Please help improve this article by adding citations to reliable sources. Unsourced material may be challenged and removed.Find sources: "Shadow"news newspapers books scholar JSTOR (March 2025) (Learn how and when to remove this message)The shadow of a musician cast onto a brick wallPark fence shadow is distorted by an uneven snow surface.Shadows from cumulus clouds thick enough to block sunlightA shadow is a dark area on a surface where light from a light source is blocked by an object. In contrast, shade occupies the three-dimensional volume behind an object with light in front of it. The cross-section of a shadow is a two-dimensional silhouette, or a reverse projection of the object blocking the light.This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. (March 2025) (Learn how and when to remove this message)Umbra, penumbra and antumbraA point source of light casts only a simple shadow, called an "umbra". For a non-point or "extended" source of light, the shadow is divided into the umbra, penumbra, and antumbra. The wider the light source, the more blurred the shadow becomes. If two penumbras overlap, the shadows appear to attract and merge. This is known as the shadow blister effect.The outlines of the shadow zones can be found by tracing the rays of light emitted by the outermost regions of the extended light source. The umbra region does not receive any direct light from any part of the light source and is the darkest. A viewer located in the umbra region cannot directly see any part of the light source. By contrast, the penumbra is illuminated by some parts of the light source, giving it an intermediate level of light intensity. A viewer located in the penumbra region will see the light source, but it is partially blocked by the object casting the shadow.If there is more than one light source, there will be several shadows, with the overlapping parts darker, and various combinations of brightnesses or even colors. The more diffuse the lighting is, the softer and more indistinct the shadow outlines become until they disappear. The lighting of an overcast sky produces few visible shadows.The absence of diffusing atmospheric effects in the vacuum of outer space produces shadows that are stark and sharply delineated by high-contrast boundaries between light and dark.For a person or object touching the surface where the shadow is projected (e.g. a person standing on the ground, or a pole in the ground) the shadows converge at the point of contact.A shadow shows, apart from distortion, the same image as the silhouette when looking at the object from the sun-side, hence the mirror image of the silhouette seen from the other side.Three moons (Callisto, Europa and Io) and their shadows parade across Jupiter.[1]The names umbra, penumbra and antumbra are often used for the shadows cast by astronomical objects, though they are sometimes used to describe levels of darkness, such as in sunspots. An astronomical object casts human-visible shadows when its apparent magnitude is equal or lower than −4.[2] The only astronomical objects able to project visible shadows onto Earth are the Sun, the Moon, and in the right conditions, Venus or Jupiter.[3][4] Night is caused by the hemisphere of a planet facing its orbital star blocking its sunlight.A shadow cast by the Earth onto the Moon is a lunar eclipse. Conversely, a shadow cast by the Moon onto the Earth is a solar eclipse.[5]The sun casts shadows that change dramatically through the day. The length of a shadow cast on the ground is proportional to the cotangent of the sun's elevation anglets angle relative to the horizon. Near sunrise and sunset, when = 0 and cot() = , shadows can be extremely long. If the sun passes directly overhead (only possible in locations between the Tropics of Cancer and Capricorn), then = 90, cot() = 0, and shadows are cast directly underneath objects.[citation needed]Such variations have long aided travellers during their travels, especially in barren regions such as the Arabian Desert.[6]See also: Lighthouse paradoxSteam phase eruption of Castle Geyser in Yellowstone National Park casts a shadow on its own steam. Crepuscular rays are also visible. The farther the distance from the object blocking the light to the surface of projection, the larger the silhouette (they are considered proportional). Also, if the object is moving, the shadow cast by the object will project an image with dimensions (length) expanding proportionally faster than the object's own rate of movement. The increase of size and movement is also true if the distance between the object of interference and the light source are closer. Eventually, this speed may exceed the speed of light.[.7] however, this does not violate special relativity as shadows do not carry any information or momentum.[citation needed]Although the edge of a shadow appears to "move" along a wall, in actuality the increase of a shadow's length is part of a new projection that propagates at the speed of light from the object of interference. Since there is no actualization between points in a shadow (except for reflections and interference of light, at the speed of light), a shadow that projects over a surface of large distances (light years) cannot convey information between those distances with the shadow's edge.[8]Visual artists are usually very aware of colored light emitted or reflected from several sources, which can generate complex multicolored shadows. Chiaroscuro, sfumato, and silhouette are examples of artistic techniques which make deliberate use of shadow effects.[9]During the daytime, a shadow cast by an opaque object illuminated by sunlight has a bluish tinge. This happens because of Rayleigh scattering, the same property that causes the sky to appear blue. The opaque object is able to block the light of the sun, but not the ambient light of the sky which is blue as the atmosphere molecules scatter blue light more effectively. As a result, the shadow appears bluish.[10]This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. (March 2025) (Learn how and when to remove this message)Fog shadow of the south tower of the Golden Gate BridgeA shadow occupies a three-dimensional volume of space, but this is usually not visible until it projects onto a reflective surface. A light fog, mist, or dust cloud can reveal the 3D presence of volumetric patterns in light and shadow.Fog shadows may look odd to viewers who are not used to seeing shadows in three dimensions. A thin fog is just dense enough to be illuminated by the light that passes through the gaps in a structure or in a tree. As a result, the path of an object's shadow through the fog becomes visible as a darkened volume. In a sense, these shadow lanes are the inverse of crepuscular rays caused by beams of light, they're caused by the shadows of solid objects.Theatrical fog and strong beams of light are sometimes used by lighting designers and visual artists who seek to highlight three-dimensional aspects of their work.This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. (March 2025) (Learn how and when to remove this message)Obtuse angle shadow on a wall, in actuality the increase of a shadow's length is part of a new projection that propagates at the speed of light from the object. A chain-link fence shadow will start with light diamonds and shadow outlines when it is touching the fence, but it will gradually blur. Eventually, if the fence is tall enough, the light pattern will go to shadow diamonds and light outlines. This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. (March 2025) (Learn how and when to remove this message)Moonlight shadow of a photographerIn photography, which is essentially recording patterns of light, shade, and color, "highlights" and "shadows" are the brightest and darkest parts, respectively, of a scene or image. Photographic exposure must be adjusted (unless special effects are wanted) to allow the film or sensor, which has limited dynamic range, to record detail in the highlights without them being washed out, and in the shadows without their becoming undifferentiated black areas.On satellite imagery and aerial photographs, taken vertically, tall buildings can be recognized as such by their long shadows (if the photographs are not taken in the tropics around noon), while these also show more of the shape of these buildings. This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. (March 2025) (Learn how and when to remove this message)Shadow as a term is often used for any occlusion or blockage, not just those with respect to light. For example, a rain shadow is a dry area, which with respect to the prevailing wind direction, is beyond a mountain range: the elevated terrain impedes rainclouds from entering the dry zone. An acoustic shadow occurs when a direct sound has been blocked or diverted around a given area.Shadows often appear in mythical or cultural contexts. Sometimes in a malevolent light, other times not.An unattended shade was thought by some cultures to be similar to that of a ghost. The name for the fear of shadows is "sciophobia" or "sciophobia".[citation needed]Chhaya is the Hindu goddess of shadows.In heraldry, when a charge is supposedly shown "in the shadow" (the appearance is of the charge merely being outlined in a neutral tint rather than being of one or more tinctures different from the field on which it is placed), it is technically described as "unblazoned". Supposedly, only a limited number of specific charges can be so depicted.[citation needed]Shadows are often linked with darkness and evil; in common folklore, like shadows who come to life, are often evil beings trying to control the people they reflect. The film Upside-Down Magic features an antagonistic shadow spirit who possesses people.[citation needed]Ancient Egyptians surmised that a shadow, which they called wt (shut), contains something of the person it represents because it is always present. Through this association, statues of people and deities were sometimes referred to as shadows.[citation needed]In Islam, shadows are a sign of submission to God. The Quran emphasizes that everything in the heavens and the earth, including shadows, prostrates to the Almighty in awe and obedience: "Do they not see how everything that Allah has created casts its shadow, inclining to the right and to the left, prostrating to Allah while they are humble?" (Quran 16:48). Similarly, the Quran states, "And to Allah prostrates whoever is within the heavens and the earth, willingly or by compulsion, and their shadows [as well] in the mornings and the afternoons" (Quran 13:15). Shadows, in this context, are a testament to the divine order and unity of creation.[citation needed]In a commentary to The Egyptian Book of the Dead (BD), Egyptologist Ogden Goelet, Jr. discusses the forms of the shadow: "In many BD papyri and tombs the deceased is depicted emerging from the tomb by day in shadow form, a thin, black, featureless silhouette of a person. The person in this form is, as we would put it, a mere shadow of his former existence, yet nonetheless still existing. Another form the shadow assumes in the BD, especially in connection with gods, is an ostrich-feather sun-shade, an object which would create a shadow." [11]Scientists from the National University of Singapore presented a shadow-effect energy generator (SEG), which consists of cells of gold deposited on a silicon wafer attached on a plastic film. The generator has a power density of 0.14 W cm2 under indoor conditions (0.001 sun).[12]Non-diffuse lighting in outer space causes deep shadowsReversed text in shadowsSutro casts a 3D fog shadow.This photo of jasmine flowers has only soft shadows cast by diffused light.Clouds, and shadows over the Mediterranean SeaShadow cast by vapor trail of passing aircraftShadow of a parent and childTree shadowsShadow on the CastleMoonlight shadowLong shadow of a dead tree with its branches on dry fields, late afternoonWhen the sun is low, shadows become long, and details get the wrong proportions.Shadows from a window blindWikimedia Commons has media related to Shadow.Black drop effectShadows in camouflageConvolution applications, for more physical and mathematical discussion about shadowsEarth's shadowGnomonRaking lightSciography, the art of architectural shadowsShadeShadow CabinetShadow mapping, in computer 3D graphicsShadow peopleShadow playShadowgraphy or ombromania, the art of hand shadows ^ "March of the moons".
